Aim: To implement Restoring division algorithm using c-programming.

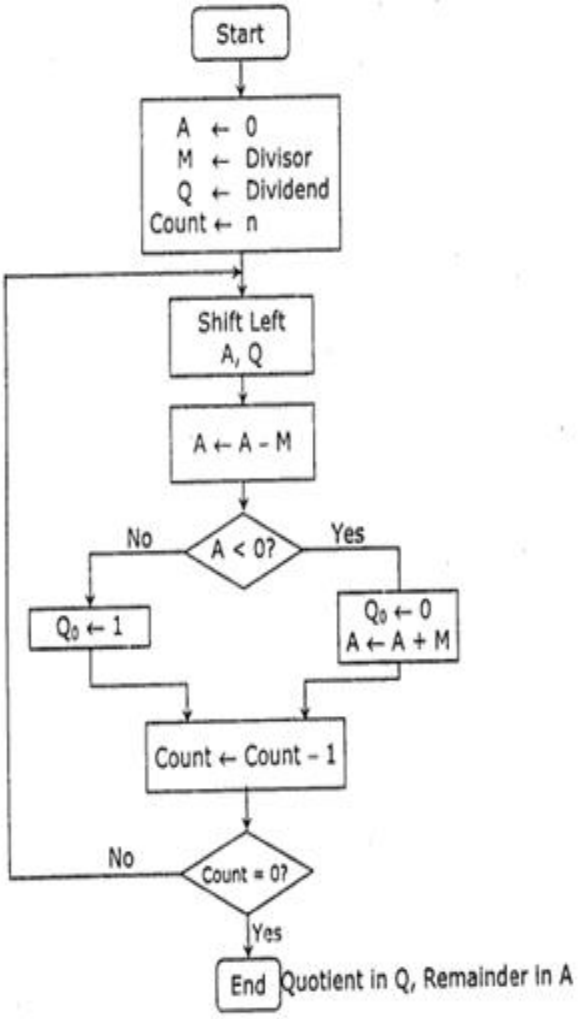
Objective -

1. To understand the working of Restoring division algorithm.
2. To understand how to implement Restoring division algorithm using c-programming.

Theory:

1) The divisor is placed in M register, the dividend placed in Q register.
2) At every step, the A and Q registers together are shifted to the left by 1-bit
3) M is subtracted from A to determine whether A divides the partial remainder. If it does, then Q0 set to 1-bit. Otherwise, Q0 gets a 0 bit and M must be added back to A to restore the previous value.
4) The count is then decremented and the process continues for n steps. At the end, the quotient is in the Q register and the remainder is in the A register.

Flowchart



Perform 8 ÷ 3 by restoring division technique.

Conclusion -

In conclusion, the implementation of the Restoring Division Algorithm using the C programming language offers a powerful method for efficient and precise division operations. Through this project, we have explored the intricacies of this algorithm, emphasizing its significance in modern computing. By leveraging C's robust features and versatility, we have successfully translated the theoretical framework of the Restoring Division Algorithm into a functional codebase. As a result, we have not only deepened our understanding of division algorithms but also honed our programming skills.
